Libra Attribution Engine

Reference implementation of the Libra Attribution Standard v0.3 ·

Module A: Corpus Apportionment · Engine v0.2

Methodology: Aswin Krishna — a recognized-contribution formula for AI training-data compensation: *to copyright settlements what recognized-loss plans are to securities settlements*.

Validation status (Standard §5, mandatory disclosure):

VALIDATED against Libra Benchmark v1 (measurable layer): calibration MAE 0.0005 across engineered copy-fractions 0.1–0.9; false-positive baseline ≤ 0.0001 on independent real texts; consolidation and reproducibility PASS. Independent replication and scale testing pending. See Libra Validation Report v1.

Legal notice: research & demonstration tool — not legal advice; outputs require professional review. **Data protection:** do NOT upload confidential or personal data to this public demo (it is processed on third-party cloud infrastructure). For real or sensitive works lists, run Libra locally per the README — your data then never leaves your machine.

1 · Corpus

Demonstration corpus (engineered ground truth) Upload works list (CSV)

28 synthetic works → 27 rightsholder claims, with three **engineered cases**: same-rightsholder editions (consolidation protects the claimant), a cross-rightsholder derivative (redundancy discount fires), and an anthology lifted from four donors.

Load demonstration corpus

Load the demonstration corpus or upload a works list to run an allocation.
